1903.

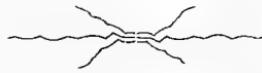

OUR TERMS

Are cash in thirty days from date of invoice unless otherwise specified.

We deliver machines free on board cars at Worcester, in good shipping order.

Extra crating or boxing will be charged for at cost of material and labor.

INTRODUCTION.

We take pleasure in offering to our customers our new illustrated catalogue, No. 2, of machinery manufactured by us. It is intended to take the place of all others heretofore issued, and we believe illustrates and describes the most complete list yet presented of desirable machines manufactured for the use of blacksmiths, carriage makers, repair and machine shops. We call special attention to the many improvements which have been made since our last issue, and we shall continue to add such improvements as seem desirable to keep the high standard of excellent workmanship, convenience and durability of our machinery.

We could, if necessary, fill a large volume with references from the thousands using our tools throughout this and foreign countries. Instead of which we guarantee our tools to do all for which we recommend them. All machines of our manufacture are offered to the mechanical public as standard of their class.

We also wish to call special attention to our illustrated list of duplicate parts for repairs to our machines, whereby they may be ordered by name or number, which will be found a great saving to our customers of express and freight charges in returning old parts to be duplicated; and last, but not least, our telegraphic code, for the convenience of our customers abroad.

During our many years of business as manufacturers it has been our constant aim to furnish only tools of standard excellence. This will still be our policy, and we respectfully solicit a continuance of the patronage with which we have been favored.

Respectfully,

BOYNTON & PLUMMER.

Worcester, Mass., U. S. A.

TO OUR CUSTOMERS ABROAD.

We wish to announce that we have added to this our new catalogue a complete telegraphic code, for the convenience of our foreign customers, by which any machine or part may be ordered by the use of one word, thereby saving much expense in cost of cablegrams.

Special attention is always paid to the boxing of export shipments, being careful to pack machines in the least possible space and to put them in as few packages as possible. We are always pleased to include small parcels, ordered from other firms, without extra cost. Any duplicate or repair part may be also included. We have given the dimensions of each machine boxed for export, and the shipping weight, but the same is greatly reduced, as well as the cost of boxing, when two or more machines are packed together. Appreciating the inconvenience to which foreign buyers are put in ordering and obtaining American goods, we have spared neither pains nor expense in making this catalogue as complete as possible and to add to the convenince of our customers abroad.

IMPROVED SHAPING MACHINES.

The Shaping Machines illustrated on following pages represent our improved machines; the capacity of each having been increased 50 per cent. or more. They will be found complete in all their appointments, made of the best material, and highest class of workmanship. The driving shafts and feed screws are of the best of steel. The screws and other parts, where necessary, are case hardened. The feed is automatic and reversible. The cutter-bar has a graduated swivel-head.

A large open space through body of machine directly under tool permits the placing of long work, such as shafts for key-setting, etc.

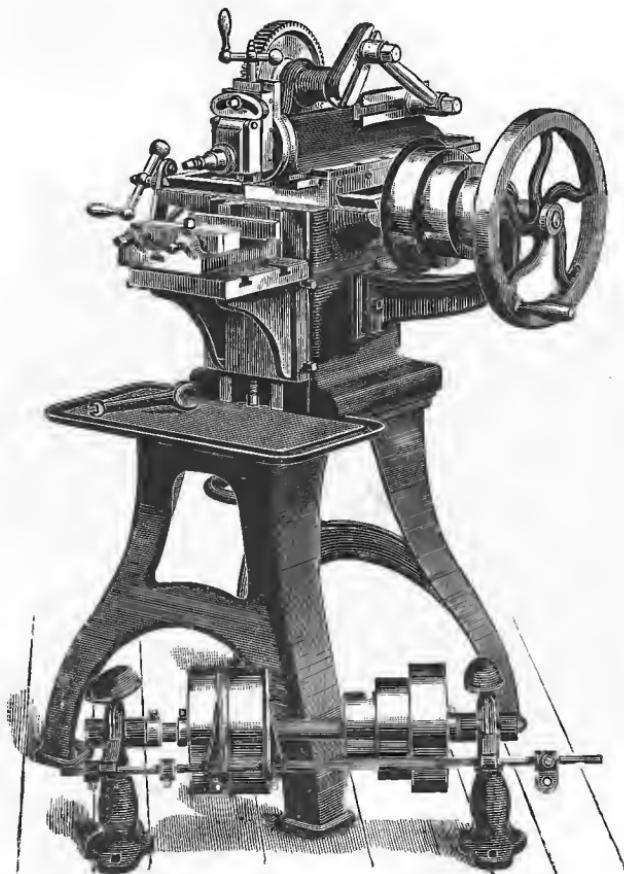

The table is adjusted by means of a screw and wheel under table on the six and eight inch, and by a crank at the side on the ten inch. They will take a stroke to their full capacity, and can easily be adjusted to any less distance required.

A swivel chuck is furnished with each machine—also a plain chuck—taking work full length of traverse when wanted.

These machines will do accurate work, and are a desirable tool for model makers, die sinkers, railroad, repair, and other shops where there is much short work to be done by filing or planing, thus saving the expense and room of a large planer, besides the large saving in files and labor required on such work.

They are guaranteed to do all that is represented, and for many purposes are preferable to higher-cost machines.

Duplicate parts of all machines furnished at short notice.

6x9-INCH TRAVERSE HEAD SHAPER.

For dimensions see opposite page.

DIMENSIONS, ETC.

Length of stroke, 6 inches.

Length of traverse, 9 inches.

Greatest distance between tool and table, 8 inches.

CIRCULAR ATTACHMENT.

The above cut represents our new circular planing attachment, by the use of which circular or cylindrical work may be planed accurately. It has worm feed, operated by ratchet lever, with which a variety of feeds may be obtained.

Distance between centres, 12 inches.

Diameter of swing, 12 inches.

Weight, 70 pounds.

Price, \$26.00.

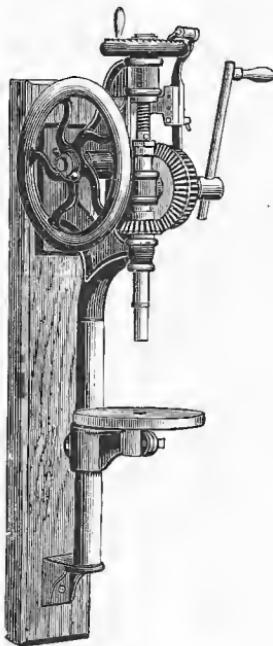

Telegraphic code, Trancholer.

DRILLING MACHINES.

In our long experience in the manufacture, sale and use of these tools, we have learned that it is not the cheapest machines that sell the best, much less give the best satisfaction. We have, therefore, been particular that all material and workmanship used in their construction should be of the best class. They have all the latest improvements adapted to such tools. In view of this the prices at which we are placing our tools on the market are as low as any machine their equal in these respects. They are considered by the trade and users of such machines as STANDARD in their line. All parts for repairs can be duplicated on receipt of orders. To obviate the necessity and expense of returning old parts to be duplicated, we have spared neither pains nor expense in illustrating and describing, in detail, all parts of our drilling machines, which may be ordered by name, number, or telegraphic code. Particular attention is paid to boxing these machines for export shipment, packing as many in each box as is practicable, thereby saving the purchaser much expense in boxing and shipping.

No. 0. UPRIGHT SELF-FEEDING DRILL.

Patented Aug. 16, 1892.

This size is intended for small, accurate work, and is a desirable tool for amateurs, electrotypers, and experimenters. The gearing is turned, finished and accurately cut. Spindle bored to receive $\frac{1}{4}$ -inch straight shank drills, and turned tapering on end to receive small chuck for wire drills. Has three grades of feed; has our patent automatic stop on feed, which prevents breaking of feed connection. Tight and loose pulleys, or 3-step cone pulley, for power are added to balance-wheel shaft, when so ordered. Drills 0 to $\frac{3}{8}$ -inch hole.

Length, 26 inches.

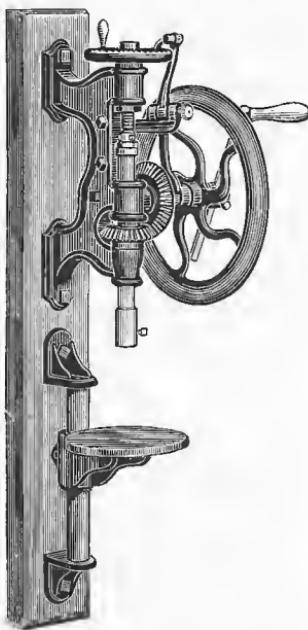

Weight, 30 pounds.

Boxed for export, 32x12x10 inches, 60 pounds.

No. 112. UPRIGHT SELF-FEEDING DRILL.

Patented Aug. 16, 1892.

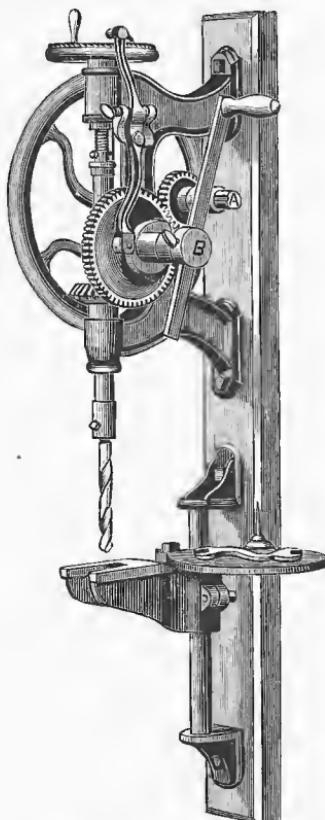

This machine, as also all others of our self-feeding drills, has nearly a continuous feed, which may be quickly adjusted by a thumb-screw to three rates of speed. A fast or slow motion may be given the drill by changing the handle from shaft (A) to shaft (B) as desired by the operator. By this arrangement the capacity of the drill has been increased nearly one-third; has our patent automatic stop on feed, which prevents breaking of feed connection. Drills 0 to $1\frac{1}{4}$ -inch hole, and to centre of 11-inch circle. Spindle takes $\frac{1}{2}$ -inch straight shank drills, or $41\frac{1}{64}$ -inch if desired, and can be made to take taper or square shank at small advance in cost.

Length, 44 inches. Weight, 120 pounds.

Boxed for export, $47\frac{1}{2} \times 17\frac{1}{2} \times 11\frac{1}{2}$ inches, 170 pounds.

Emery-wheel grinders and wheel-holders furnished for our drills having balance wheel on side when desired.	

No. 2. UPRIGHT SELF-FEEDING DRILL.

Patented Aug. 16, 1892.

The swing table, as applied to these machines, will be found useful in many ways, and much more convenient than the old method of driving them in and out with a hammer, thereby running the risk of breaking the foot-piece. It is out of the way when not in use, and may be quickly swung into position when wanted.

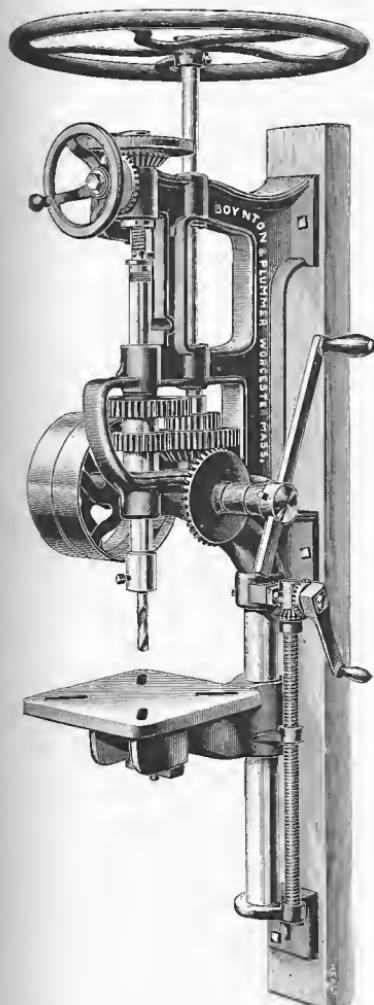

This machine, as also the No. 1½, is particularly adapted for power by attaching tight and loose pulleys, or cone pulley, to shaft (A) outside of balance wheel. See illustration of No. 7 drill. Spindle takes $\frac{1}{2}$ -inch straight shank drills, or 41-64-inch if desired, and can be made to take square or taper shank at small advance in cost. Has our patent automatic stop on feed, which prevents breaking of feed connection. Drills 0 to 1½-inch hole, and to centre of 15-inch circle.

Length, 54 inches. Weight, 160 pounds.
Boxed for export, 56x20½x13 inches, 240 pounds.

No. 3.

**IMPROVED UPRIGHT
SELF-FEEDING
DRILL.**

Patented Aug. 16, 1892.

No. 3 has cut gears so arranged that a quick or slow motion may be given the drill, for light and heavy work, making a desirable tool for machine shop or factory, answering as well as higher-cost machines. Spindle takes 41-64-inch straight shank drills, or $\frac{1}{2}$ -inch if desired, and can be made to take square or taper shank at small advance in cost. Has our patent automatic stop on feed, which prevents breaking of feed connection. When used with 3-step cone pulley has six changes of speed. It has mechanical device for raising and lowering table. Also wheel on front of machine for hand feed and quick return. Hand machine can be converted into power at any time by the addition of pulleys. Drills 0 to $1\frac{1}{2}$ -inch hole, and

to centre of 21-inch circle. Speed of pulley for ordinary work, about 180 turns per minute.

Length, 69 inches.

Weight, 325 pounds.

No. 4. UPRIGHT SELF-FEEDING DRILL.

No. 4 is mounted on iron back; has cut gears, arranged as No. 3, for fast or slow motion. The spindle, not being burdened with the weight of the balance wheel, is quickly operated by the hand wheel in front. Like No. 3, when used with 3-step cone pulley, has six changes of speed. Drills 0 to $1\frac{1}{2}$ -inch hole, and to centre of $17\frac{1}{2}$ -inch circle. Spindle takes 41-64-inch straight shank drills, or $\frac{1}{2}$ -inch if desired, and can be made to take square or taper shank at small advance in cost. Hand machine can be converted into power at any time by the addition of pulleys. Speed of pulley for ordinary work, about 170 turns per minute. Size of driving pulley, 10 inches, for $2\frac{1}{2}$ -inch belt; cone pulley, 10, 8, and 6 inches, for $2\frac{1}{4}$ -inch belt.

No. 13. IMPROVED UPRIGHT POWER DRILL.
(Lever Feed.)

Patented March 13, 1883.

The above represents a power drill, with lever feed, fastened to tubular iron column. It is a very suitable machine for blacksmith and other shops where power is used. It is furnished with a square table and forked foot-piece, as shown in cut of our No. 3 drill, or with round table and foot-piece, as shown in above cut, as desired. Drills to the centre of 19-inch circle. Greatest distance between table and spindle, 21 inches; traverse of spindle, 8 inches. Spindle is fitted for 41-64-inch straight shank drills, or $\frac{1}{2}$ -inch if desired and

can be made to take taper or square shank at small advance in cost. It has mechanical device for raising and lowering table. Three-step cone pulley, $8\frac{1}{2}$, $6\frac{1}{2}$, $4\frac{1}{2}$ inches, for $2\frac{1}{4}$ -inch belt. Tight and loose pulleys on counter-shaft, 10 inches, for $2\frac{1}{2}$ -inch belt.

Length, 63 inches.

Weight, 330 pounds.

Boxed for export, $64\frac{1}{2} \times 28 \times 15$ inches, 420 pounds.

No. 14. IMPROVED UPRIGHT POWER DRILL.

(Lever and Screw Feed, 24-Inch Swing.)

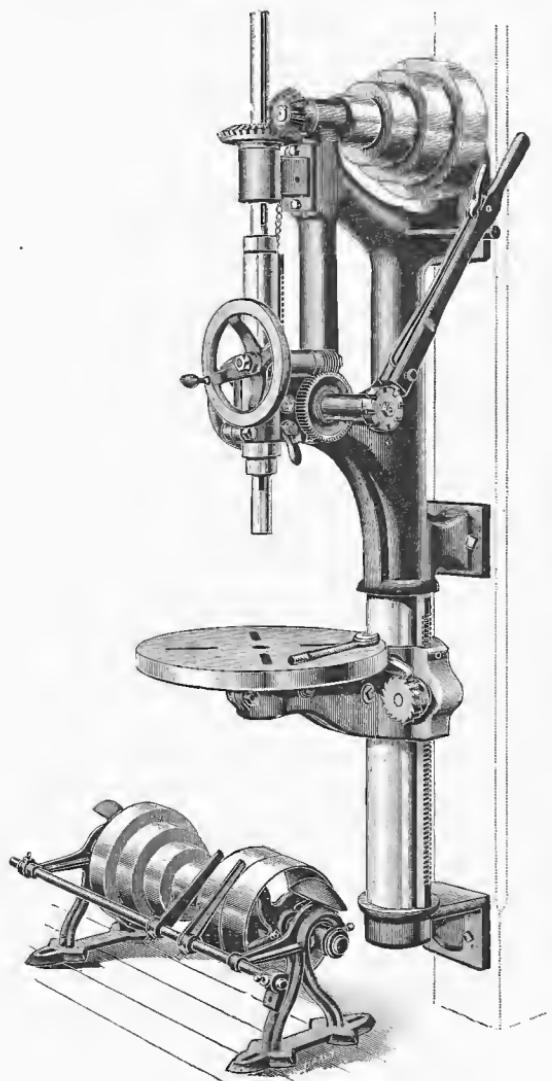

Fig. 1.

For description of above drill see opposite page.

DESCRIPTION OF IMPROVED No. 14 DRILL.

The machine represented by Fig. 1 is adapted to the wants of machine and other shops desiring a first-class drill of large capacity, so constructed as to require the least possible space for its occupancy. It has strong and heavy brackets, and, when bolted to post or wall, is very rigid in position. It is made with screw and lever feed, combined or singly.

It is fitted with 4-step cone pulley of large dimensions for $2\frac{3}{4}$ -inch belt, which will give a good variety of speeds. It has a very large revolving table, properly slotted for bolting work to same.

The hole in steel spindle (which is counterbalanced) is fitted for Morse taper No. 3, although sockets for taking chucks, square or straight shank drills are furnished at small advance in cost when desired.

Distance from post to centre of table, 12 inches. Diameter of table, 20 inches. Greatest distance between table and spindle, 24 inches. Vertical traverse of spindle, 11 inches. Diameter of cone pulley, 11, $8\frac{3}{4}$, $6\frac{1}{4}$ and 4 inches, for $2\frac{3}{4}$ -inch belt. Diameter of tight and loose pulleys on counter-shaft, 10 inches for 3-inch belt. Revolutions per minute, 230. Entire length of drill, 72 inches.

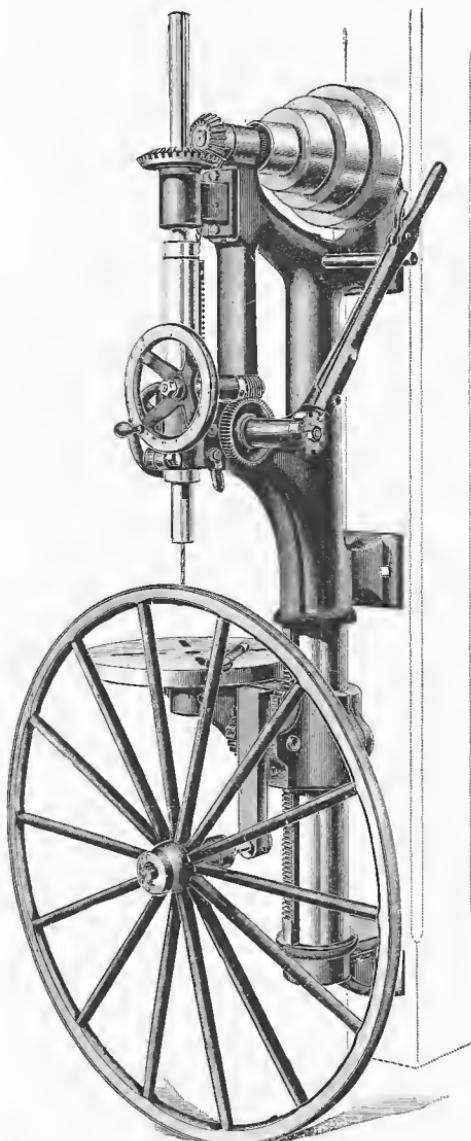

Weight, 610 pounds.

Boxed for export, 74x34x22 inches, 735 pounds.

No. 15. OVERHEAD OR HANGING DRILL.

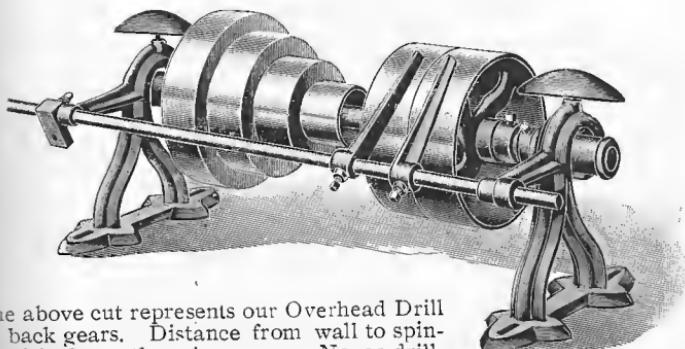

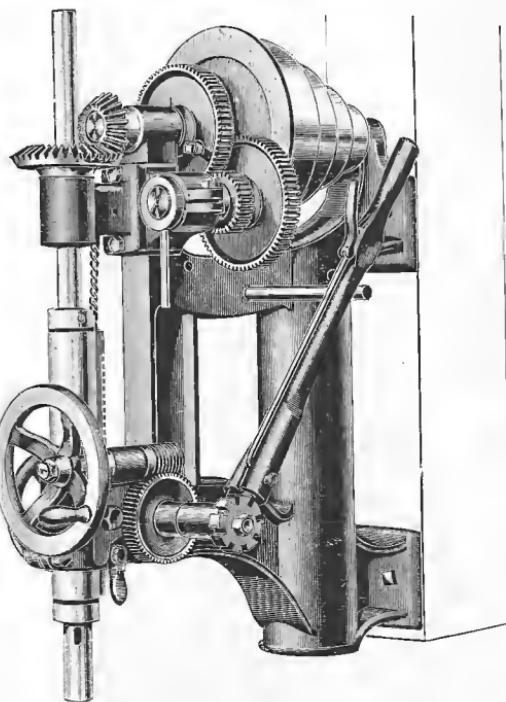

(With motor direct attached.)

Prices quoted on application.

No. 16. IMPROVED OVERHEAD OR HANGING DRILL.

(Back Geared. Lever and Screw Feed.)

The above cut represents our Overhead Drill with back gears. Distance from wall to spindle, 24 $\frac{1}{2}$ inches; otherwise, same as No. 15 drill.

Length, 36 inches.

Weight, 440 pounds.

Boxed for export, 38x34x18 inches, 515 pounds.

Telegraphic Code.

**DESCRIPTION OF THE
AUTOMATIC SELF-RAISING QUICK RETURN
as used on our Drills Nos. 17, 18, and 19.**

The feed screw has a small hole drilled its entire length, through which an extension from the spindle passes upward, and projecting through the top sufficiently for a small spiral spring and compression collar to be attached. This spring, being compressed sufficiently to overcome the slight friction of the feed screw in the feed nut, compels the feed screw to turn with the spindle and run up or down with it whichever way the machine is turned.

The thread on the feed screw being left hand, it runs upward when the machine is turned forward.

On the lower end of the feed screw is placed a clamping collar with a projection engaging in a slot in the frame of the drill. When the clamping screw in this collar is tight the feed screw is prevented from turning with the spindle and is actuated by the feed nut and automatic feed lever.

When the drill spindle has been forced downward to the extreme limit, a trip finger attached to clamping screw in collar comes in contact with a projection on the frame of the drill, and releases the clamping collar, permitting the feed screw to revolve with spindle and return to its starting point in a few revolutions.

The clamping screw in collar can be operated by the left hand releasing or engaging the feed at will, thereby giving the operator complete control of the machine without stopping it or taking his hand from the crank.

GEARING.

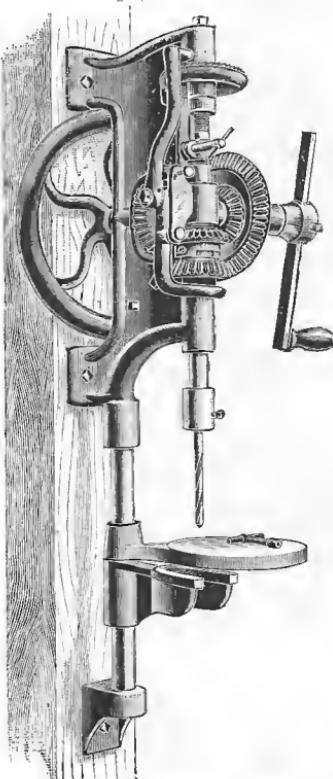

On all our double geared drills where balance wheel is placed on rear of frame, the change from fast to slow speed is quickly made and in the following manner: The upper gear on the spindle is slipped upward as far as possible, when it meshes with the small gear on crank shaft and is fastened by a set screw to the sleeve on which it slides and to which it is splined.

To reverse the operation, loosen the set screw and drop the gear until it locks to the lower gear by a clutch provided for this purpose.

With this system the balance wheel is driven at the same speed as the spindle on light work and nearly three times as fast on heavy work.

All the above mentioned drills are fitted with ball bearings where feed screw presses on to spindle.

No. 17. UPRIGHT SELF-FEEDING DRILL.

Patented May 22, 1894.

The above machine is double geared. Feed is adjustable to three changes. Has automatic Self-releasing Quick Return. Drills from 0 to $1\frac{1}{4}$ -inch hole, 3 inches deep, and to centre of 12-inch circle. Spindle arranged for $\frac{1}{2}$ -inch straight shank drills, or 41-64-inch if desired, and can be made to take taper or square shank drill at small advance in cost.

Length, 48 inches.

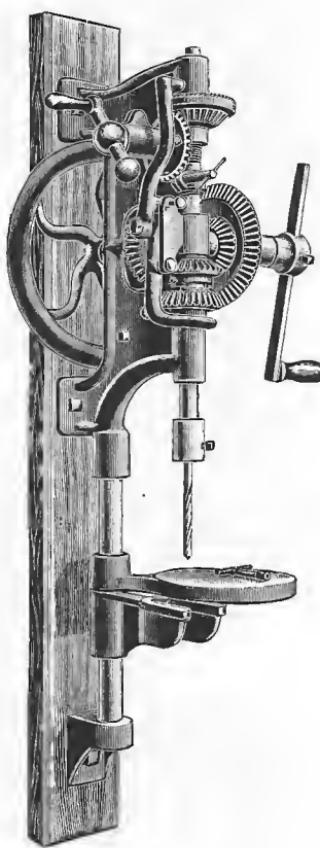

Weight, 135 pounds.

Boxed for export, 54x18x18 inches, 215 pounds.

NEW SWIVEL CLAMP DRILLS.

(Self-Feeding.)

All of our clamp drills are furnished with our patent self-feeding attachment (not shown in illustrations), an entirely new feature in drills of this kind. This also, by reversing the motion of handle, secures a quick return of the drill bit, and leaves one hand always free to handle the work. No clamp drill is complete without it. These machines can also be used as a ratchet drill by adjustment of handle. All material used in their construction is of best quality. Are indispensable to iron bridge builders, architectural iron workers, boiler makers, railroad contractors, miners, etc., etc.

Spindle and post are of steel; clamps and swivel joints of malleable iron. Drill chucks can be fitted to machine when desired.

No. 1. NEW SWIVEL CLAMP DRILL.
(Self-feeding.)

The above cut represents our No. 1 machine. Crank or handle is attached direct to spindle, and is a most convenient tool for light work. Drills 0 to $\frac{3}{8}$ -inch hole. Traverse of spindle, $2\frac{1}{2}$ inches. Greatest distance between clamps, 8 inches. Full length of post, 26 inches. Greatest distance from post to drill bit, $6\frac{1}{2}$ inches. Diameter of post, $1\frac{1}{4}$ inches. Spindle is arranged for $\frac{1}{2}$ -inch straight shank drills, or $41\text{-}64$ -inch if desired.

Weight, 28 pounds.

Boxed for export, 28x18x10 inches, 60 pounds.

Telegraphic Code.

BOLT-CUTTING AND NUT-TAPPING MACHINES.

The following cuts represent our Bolt-cutting and Nut-tapping Machines, adapted for threading all sizes of bolts and nuts from $\frac{1}{4}$ to $1\frac{1}{2}$ inches in diameter. With these machines, large sized bolts can be threaded with greater ease and facility than with any other of similar make; while small sizes can be cut as rapidly as with a small machine. For cutting threads on large bolts, the machine is operated by the crank handle in the balance wheel. The side crank is used when greater speed and less power are required, as when cutting small bolts, or for backing out large ones after they have been cut. Either of these crank devices may be quickly detached, so that the other may be used separately, or both may be used together. The vise-jaws for holding the bolts are made from fine hardened steel, are connected by a one-inch steel operating screw, while the tap-jaws are of similar construction, thus rendering the machine very strong and durable, and not liable to become quickly worn out by use. These machines are constructed to accomplish the work intended, with the least number of parts to get out of repair, of any tool of their kind. They are easily operated and in many cases take the place and are more desirable than a higher cost machine. We are confident that it will prove to the advantage of persons desiring machines of this class, to consider the relative merits and capacity of these machines before adopting another.

All sizes of bolt-cutters, when ordered, without specifying to the contrary, are furnished with taps and dies for rough iron sizes, that is, $1-32$ inch large; and V thread. Solid or adjustable dies furnished, as may be desired. In ordering, please be careful to state whether solid or adjustable dies are wanted.

All parts for repairs can be duplicated on receipt of orders.

No. 1. IMPROVED HAND BOLT CUTTER AND NUT TAPPER.

Cuts $\frac{1}{4}$, $\frac{5}{16}$, $\frac{3}{8}$, $\frac{7}{16}$, $\frac{1}{2}$, $\frac{5}{8}$, $\frac{3}{4}$ inch.

Tranche.	87.00

Will head bolts any length desired.

These machines are a valuable tool in shops using bolts of any kind, as the time going to store for ready-made bolts and welding same to make a long bolt is saved by making the bolt-head on this machine. They are strongly built, and capable of standing a large amount of heavy work.

No. 1 TIRE BENDER.

This is a strong and well-made machine, having open side so that tires can be taken out without springing. The bearings or track of carriages on all our tire benders are planed perfectly parallel, which insures the tire going through the rolls and the ends coming together perfectly square. A pair of grooved rolls for bending iron edgewise is furnished when ordered. Also tight and loose pulleys can be fitted to the machine for power when desired. It will bend tires from the lightest to $\frac{3}{4}$ inch thick by 5 wide.

Geared 9 to 1. Speed for pulleys about 120 turns per minute.
Weight, 500 pounds. Boxed for export, 34x22x21 inches, 550 pounds.

Telegraphic Code.

Trancazio.	With grooved rolls and 14x3-inch pulleys for power,	48.00

No. 3 TIRE BENDER.

This machine is very powerful, and especially designed for very heavy work, but is adapted to bending from the lightest to the heaviest tires, taking $\frac{1}{4}$ inch to $1\frac{1}{4}$ inches thick and to 10 inches wide. The upper and lower stationary rolls are geared together by very strong gears, and so arranged that the tire can be taken out after bending without removing any of the gears or rolls, by slipping the side bar or brace off from the shaft of the top roll, when it will swing down on lower stud or shaft. For bending iron edgewise it is furnished with collars, which are slipped over the rolls to form a groove; same collars are also used when bending very light tires for a small circle. Rolls are made of steel.

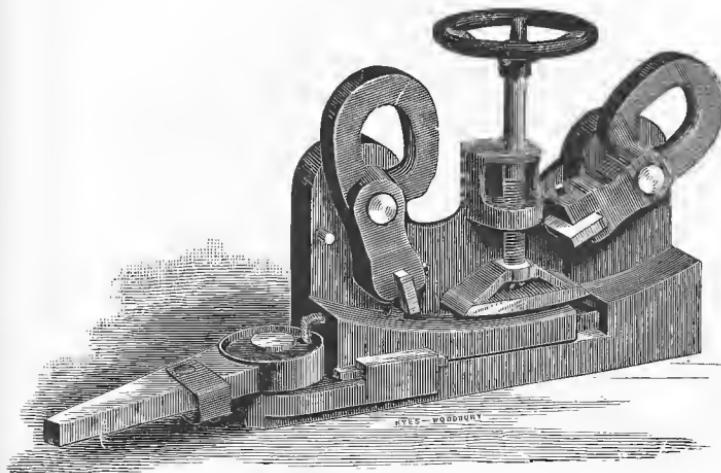

Geared 18 to 1.

Weight, 1000 pounds.

Boxed for export, 43x43x34 inches, 1155 pounds.

Telegraphic Code.	Price.
Trancadura.	Complete for hand, \$100.00
Trancedly.	Complete with 18x4-inch tight and loose pulleys for power, 120.00
Speed for pulleys, about 60 turns per minute.	

No. 1. TIRE SHRINKER.

No. 1 will upset tires $\frac{5}{8}$ inch thick by 4 inches wide. Is furnished with clamp in centre, which is brought down on tire by means of wheel and screw, to prevent tire from kinking when being upset.

Weight, 150 pounds.

Boxed for export, 22x17x12 inches, 185 pounds.

Telegraphic Code.

Price.

\$20.00

No. 2. TIRE SHRINKER.

Is the same as No. 1 without the clamp, wheel and screw, kinking of the tire being prevented by hammer in the hands of operator.

Weight, 125 pounds.

Boxed for export, 22x17x12 inches, 160 pounds.

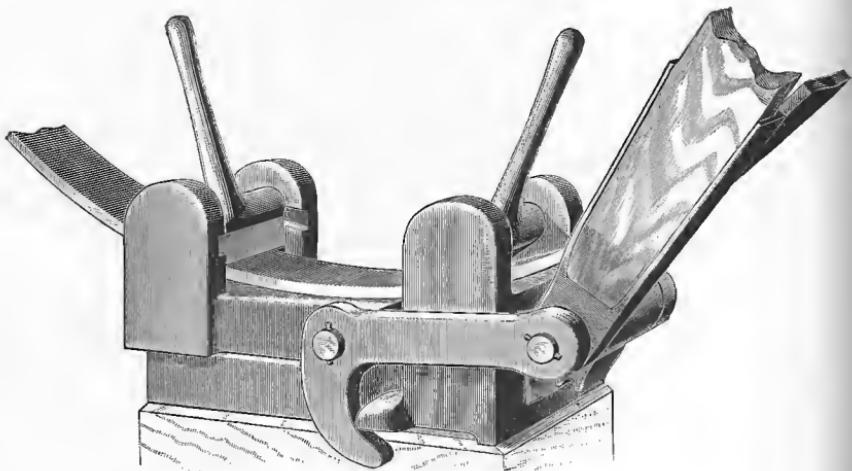

Telegraphic Code.

Tramuti.

Price.

\$15.00

No. 3. TIRE SHRINKER.

No. 3 is a large machine especially adapted for all sizes of tires, to 1 1-4 inches thick, to 8 inches wide.

Weight, 400 pounds.

Boxed for export, 28x25x19 inches, 500 pounds.

Telegraphic Code.	Price.
Tramwagen.	\$60.00

Directions. When setting the machine, fasten it securely on a block about one foot high; fasten block to floor or ground in a solid manner; see that lever holder is put on so as to get the full use of cam. Use the longest dogs or clamps for thinnest tires. See that work when set has a bearing on machine under dogs as much as possible; use a strong, hard wood lever eight or ten feet long; fasten same in lever socket. Heat the work to a good white heat, and after bringing dogs down on work, apply the power to lever, bringing it down to a horizontal position.

No. 4. TIRE SHRINKER.

Same as No 3, but smaller, taking tires to $\frac{7}{8}$ inch thick, to 5 inches wide.

Weight, 225 pounds.

Boxed for export, 24x22x17 inches, 300 pounds.

Telegraphic Code.	Price.
Tramway.	\$25.00

POR TABLE FORGES.

TO THE DEALER IN FORGES.

We can say that in the illustrations following we present the most complete line of portable forges ever offered to the trade, in the variety of sizes and in manner of operating with gear or by clutch.

TO THE USER.

We say that being the latest on the market, we have been able to take advantage of all the errors of past manufactures, so as to eliminate all defects and errors heretofore made, and combine in these forges all the best elements desirable in a tool of this kind.

We intend that these forges, like our well-known drilling machines, shall be the *standard* tool of this kind on the market. It therefore seems needless for us to say that they are made in the best manner, and that the materials used in their construction are of the best quality.

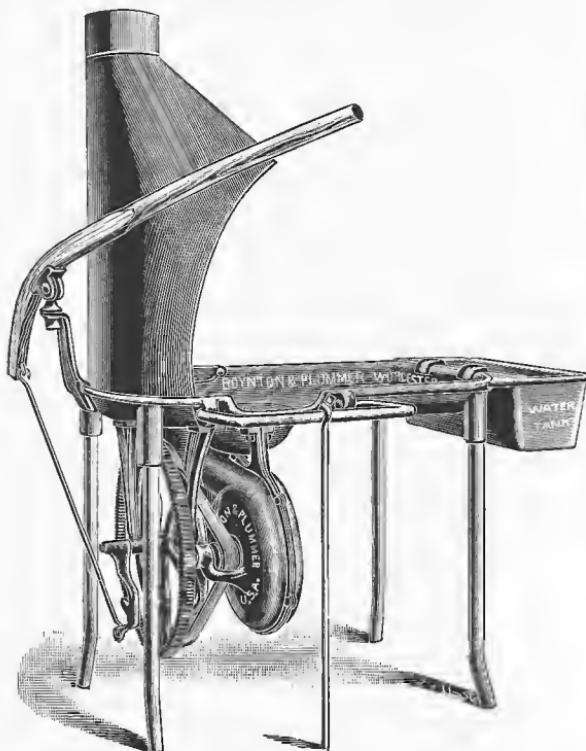

Our geared forges are constructed so as to prevent the least possible noise. The device used is a small gear made to run on the inside of the large gear, and in operating is made to lock into same by means of a pawl operating on the small gear; this also prevents any wear on the large gear by the pawl as on forges of this kind, making it almost impossible to wear it out.

The special feature in our clutch forge is the simplicity of its clutch; fewer pieces are used in it than any clutch made—being entirely free from a mass of traps, such as bolts and nuts, leathers, rubber balls, etc.; it is practically indestructible; particularly adapted to parties desiring a forge without noise, and where a geared forge would be undesirable.

Hoods on our forges are made of sheet-steel, which makes them strong and stiff.

All parts for repairs can be furnished on receipt of orders.

No. 0. BLACKSMITH'S GEARED FORGE.

This forge is adapted to blacksmith shops, or to shops having a large amount of heavy blacksmithing. It is superior to a bellows and brick forge, costs less, and has the advantage over such, as it can be placed in any location in the shop regardless of the chimney. It is capable of producing welding heat on 3-inch iron in four minutes, or 4-inch iron in ten minutes.

Height, 32 inches; hearth, $46\frac{1}{2} \times 26$ inches; without tank, 38×26 inches; fan, 14 inches; weight, 325 pounds; without tank, 275 pounds. Packed for export, $40 \times 36 \times 32$ inches, 350 pounds.
